

**AMENDMENT TO THE CLAIMS**

*The following claim listing replaces all prior listings and versions of the claims:*

**LISTING OF CLAIMS**

1. (Currently Amended) A portable container system for application of an enema solution, the system comprising:

a container for storing the enema solution;

a hose for applying the enema solution and connected to a bottom face of the container;

and

a supporting structure including a top plate on which the container is disposed, a base plate, and a support member disposed between the top plate and the bottom plate for connecting the top plate and the bottom plate.

2. (Previously presented) The portable container system of claim 1, wherein the supporting structure is configured to hold the container at a height to cause a difference in pressure between the container and an intestine for applying the enema solution into the intestine freely.

3. (Previously presented) The portable container system of claim 1, wherein the supporting structure is configured to be disassembled.

4. (Previously presented) The portable container system of claim 3, wherein the supporting structure is configured so that, when the support structure is disassembled, all pieces of the supporting structure fit inside the container, either together or separately.

5. (Currently Amended) The portable container system of claim 1, wherein the support member comprises a plurality of support members, each of which has a same length.

6. (Previously presented) The portable container system of claim 1, wherein the top plate has a fissure serving as a guide for hose.

7. (Currently Amended) The portable container system of claim 1, wherein the supporting structure further comprises a middle plate connected to the plurality of support member members.

8. (Previously presented) The portable container system of claim 4, wherein the support member comprises a plurality of support hoses each of which has a same or less height than a height of the container.

9. (Currently Amended) A portable container system for applying enema solution, the system comprising:

a container for storing the enema solution;

a hose for applying the enema solution, the hose being configured to be connectable to a bottom face of the container; and

a supporting structure including a top plate, a base plate, and a support member, wherein the system is configured so that:

when the system is in storage, the container holds the hose and the supporting structure within the container, and

when the system is in use for applying the enema solution, the supporting member is disposed between the top plate and the bottom plate for connecting the top plate and the bottom plate, the tube is connected to the bottom face of the container, and the container is disposed on the top plate.

10. (New) The portable container system of claim 1, wherein the container is disposed on a center axis of the supporting structure in a vertical direction.

11. (New) The portable container system of claim 9, wherein the container is disposed on a center axis of the supporting structure in a vertical direction.
